SUMMARY

Software engineer specializing in frontend platform, web infrastructure and developer experience - React/TypeScript architecture combined with CI/CD, monorepo release automation and dependency orchestration. Builds shared frontend systems and developer tooling whose users are other engineers, focused on developer productivity: fewer manual touchpoints, safer releases, fewer defects reaching production.

EXPERIENCE

GoDaddy | Software Development Engineer II | Remote | Jan 2025 - Present

- Architected **cross-repository release automation** across four shared frontend and deployment repositories using **GitHub Actions** reusable workflows and composite actions, **Changesets** and **Syncpack** - turning shared-package releases into validated downstream dependency-update PRs and removing 20-40 minutes of manual version coordination per propagation, against a multiple-times-daily release cadence.
- Designed **release-state reconciliation** for overlapping package events, coalescing pending bumps and resolving synchronized dependency groups before PR generation - closing a recurring class of **production defects** where shared-package versions shipped decoupled from the changes they belonged to, and removing the coordination cost that had teams deferring deploys into large batches.
- Built centralized **release and deployment orchestration**, standardizing cross-repository release metadata and reusable automation across shared frontend and downstream deployment paths, replacing workflow logic duplicated per repository.
- Hardened shared frontend **CI and build workflows** for merge queues and high-concurrency development - `merge_group` validation, selective path-based execution and obsolete-run cancellation, cutting redundant compute across high-activity repositories.
- Designed a generalized **sticky-stack framework** using `React createPortal`, dynamic registration and custom hooks, coordinating stacking order and measured offsets across independently rendered CMS navigation roots without fixed per-component offsets.
- Primary reviewer and support point for **CI/CD and release workflows** across frontend teams, and participant in the **on-call rotation** for shared front-of-site infrastructure - triaging production incidents and feeding recurring failures back into automation and documentation.

GoDaddy | Software Development Engineer | Remote | Jul 2022 - Jan 2025

- Developed a shared multi-brand React/TypeScript **component library** across a 13-package monorepo consumed by dozens of engineers on multiple frontend teams, including theme/intent abstractions that decoupled component behavior from brand presentation so common UI could serve GoDaddy and 123 Reg without forked implementations, with **internationalization** handled at the shared-component layer so consuming teams inherited localized behavior by default.
- Improved perceived performance across GoDaddy **front-of-site** pages using hover-driven prefetching and asynchronous asset loading, and modernized legacy React class components to hooks across GTLD/domain experiences while extending TLD-availability and domain-purchase integrations.
- Contributed to **Sitecore-to-Contentful modernization**, building shared content-to-component rendering integrations and **SSR-safe** server/client boundaries for reusable components in a Next.js/Gasket architecture.
- Documented reusable components in **Storybook** with automated **test** coverage in Jest and Cypress, and designed and taught a four-hour **React bootcamp** for interns using a progressive training repository and live instruction.

Revature | Software Engineer | Remote | Sep 2021 - May 2022

- Built an internal e-commerce **Angular** single-page application spanning registration, authentication, product browsing and checkout, backed by PostgreSQL data models tuned through indexing and query refactoring; implemented S3 image upload with lifecycle management and owned the repository's branching and pull-request workflow.
- **Verizon (client engagement)**: supported decomposition of backend services from a monolith into **Spring microservices**, applying API gateway and service-discovery patterns and documenting class/method relationships to guide engineers building microservice equivalents.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, HTML, CSS, SQL

Frontend & Web Platform: React, Next.js, Node.js, SSR & hydration, Storybook, Contentful, Sitecore, Angular, component architecture, internationalization (i18n)

Developer Experience & Delivery: GitHub Actions (reusable workflows, composite actions, merge queues), CI/CD, release automation, build automation, developer tooling, Changesets, Syncpack, package versioning & publishing, dependency management, monorepo workflows

Testing & Tooling: Jest, Cypress, Webpack, ESLint, Git, PostgreSQL, code review, on-call & incident response

EDUCATION

M.B.A., Information Technology Management - Western Governors University, 2025

B.S., Computer Science - California State University, Monterey Bay, 2022
