SUMMARY

Software engineer with 5 years of experience building customer-facing web applications in React, TypeScript, Next.js, and Node.js. At GoDaddy, works across the website that turns Contentful content into server-rendered pages for GoDaddy, Afternic, and 123 Reg through a shared React component library, and built the GitHub Actions release automation that ships it.

EXPERIENCE

GoDaddy | Remote | Jul 2022 – Present
Software Development Engineer II (Jan 2025 – Present) | *Software Development Engineer (Jul 2022 – Jan 2025)*

- Build and maintain GoDaddy's customer-facing website across the stack, split about evenly between the React frontend and the server-rendered Node.js/TypeScript layer that renders Contentful content for three brands (GoDaddy, Afternic, and 123 Reg); on the site's on-call rotation.
- Maintain the server-side content and integration layer, transforming Contentful content into component data and integrating company service APIs and CDN delivery for routing, navigation, search, and brand configuration.
- Developed a shared multi-brand React and TypeScript component library in a 13-package monorepo used by dozens of engineers across multiple teams, with theme abstractions so all three brands share components without forks.
- Rebuilt GoDaddy's gTLD product page, a page that drives $1M+ per year in revenue, and extended the TLD-availability and domain-purchase integrations across domain experiences.
- Implemented internationalization, including right-to-left layout and translation handling, in shared components used across all three brands.
- Contributed to migrating the platform from React 18 to React 19, resolving breaking changes across the component library and the applications that consume it.
- Designed a portal-based sticky-navigation framework with React createPortal and custom hooks, coordinating independently rendered CMS navigation components with dynamic ordering and offsets.
- Built cross-repository release automation with GitHub Actions reusable workflows and composite actions, Changesets, and Syncpack, and hardened merge-queue CI for repositories running 100+ workflow runs per day; primary CI/CD reviewer across frontend teams, recognized by manager and TPM as the team's CI/CD expert.

Revature | Software Engineer | Remote | Sep 2021 – May 2022
Client engagement: Verizon

- Built an internal e-commerce Angular single-page application covering registration, authentication, product browsing, and checkout, backed by a PostgreSQL database.
- Supported Verizon's move of backend services from a monolith to microservices, applying API gateway and service-discovery patterns and documenting class relationships for the engineers building the new services.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, HTML, CSS
Frontend: React (18/19), Next.js, Server-Side Rendering, Storybook, Internationalization/RTL
Backend: Node.js, Contentful (headless CMS), service API integration, CDN delivery
CI/CD & Testing: GitHub Actions (reusable workflows, composite actions), merge queues, Changesets, Jest, Cypress

EDUCATION

B.S., Computer Science — California State University, Monterey Bay, 2022
M.B.A., Information Technology Management — Western Governors University, 2025
